

Experiment - 1

Basic Python codes

- 1) Find the square root of number

```
import math  
n = int(input())  
print(math.sqrt(n))  
→ 4  
2.0
```

- 2) Swap two numbers

```
a = int(input("Enter 1st num:"))  
b = int(input("Enter 2nd num:"))  
c = a  
a = b  
b = c  
print(a)  
print(b)  
→ Enter 1st num = 2  
Enter 2nd num = 3  
3  
2
```

- 3) Check num is positive or not

```
n = int(input())  
if (n >= 0):  
    print("num is positive")  
else:  
    print("num is negative")  
→ 4  
num is positive
```

4) Check num is even or odd

```
n = int(input())
if (n%2 == 0):
    print("num is even")
else:
    print("num is odd")
```

→ 5

num is odd

5) Find the factorial of num

```
import math
n = int(input())
print(math.factorial(n))
```

→ 3

6

6) Check whether the number is palindrome

```
n = input()
if (n == n[::-1]):
    print("Palindrome")
```

else:

```
    print("not palindrome")
```

→ 323

Palindrome

7) Use pandas to create a dataset, print age & age²

```
import pandas as pd
data = {"Name": ["Hari", "Vanshi", "Attan"],
        "Age": [20, 25, 27],
        "City": ["bgl", "hyd", "pune"]}
df = pd.DataFrame(data)
print(df)
```

→ 0 Name Age City
 1 Vanshi 25 hyd
 2 Atton 27 pune

df["Age"]

→ Age
 0 20
 1 25
 2 27

df[df["Age"] > 25]

→ Name Age City
 2 Vanshi 27 pune

8) Implement AND gate with 3 inputs

def AND-gate (a, b, c):

return (a and b & c)

input = [(0, 0, 0),

(0, 0, 1),

(0, 1, 0),

(0, 1, 1),

(1, 0, 0),

(1, 0, 1),

(1, 1, 0),

(1, 1, 1)]

print ("ABC | output").

print (" - - - -")

for a,b,c in inputs:

print(f " {a} {b} {c} {int(AND-gate(a,b,c))} ")

$$\rightarrow \begin{array}{r} A \\ - \\ B \\ \hline C \\ - \\ D \end{array} \quad \begin{array}{r} 1 \\ - \\ 0 \\ \hline 0 \end{array} \quad \text{output}$$

$$\begin{array}{r} 0 \\ 0 \\ 0 \end{array} \quad \begin{array}{r} 0 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\rightarrow \begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 1 \\ 0 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 1 \\ 0 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

$$\begin{array}{r} 1 \\ 1 \\ 1 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array} \quad \begin{array}{r} 0 \\ 0 \\ 0 \end{array}$$

Experiment - 2

```
a) from transformers import pipeline  
sentiment_analyzer = pipeline("sentiment_analysis")  
text = "I am feeling happy"  
Sentiment_result = sentiment_analyzer(text)  
print ("Sentiment analysis:")  
print(f"Sentiment : {Sentiment_result[0]['label']}  
(Score: {Sentiment_result[0]['score']:.2f})")
```

Output:

b) Sentiment Analysis:

Sentiment: POSITIVE (Score : 1.00)

```
from transformers import pipeline
```

```
translator_en_to_fr = pipeline("translation-in-to-fr",  
model = "Helsinki-NLP/opus-mt-en-fr")
```

text = "I am feeling happy"

```
translation_result = translator_en_to_fr(text)
```

print ("Translation:")

```
print(f"Translated text: {translation_result[0]}  
[translation_text]\n")
```

Output:

config.json 1.42KB

python-model.bin 100.1

generation-config.json 100.1

tokenizer-config.json 100.1

model-safetensors 100.1

target.spm 100.1

vocab.json

Translation:

Translated text: Je me sens heureuse.

c)

```
! Pip install pytesseract  
! pip install pillow  
! pip install transformers  
  
import pytesseract  
from PIL import Image  
from transformers import pipeline  
input = "/content/image.jpg"  
input_image = Image.open(input)  
text_output = pytesseract.image_to_string(input_image)  
print(text_output)  
  
from transformers import pipeline  
sentiment_analyzer = pipeline("sentiment-analysis")  
text = text_output  
Sentiment_result = sentiment_analyzer(text)  
print(f"Sentiment analysis: {Sentiment_result}")  
print(f"Text: {text}")  
print(f"Sentiment: {Sentiment_result[0]['label']}  
Score: {Sentiment_result[0]['score']:.2f}")
```

Output:

• Sentiment analysis:
Text: It was the best of times, it was the worst of times, it was the age of wisdom, it was the age of foolishness
Sentiment: NEGATIVE Score: 0.98

Variational Autoencoder

```
import numpy as np  
import tensorflow as tf  
import keras  
from keras import layers.
```

Algorithm:

1) Define Sampling layer

- Take mean & log variance from encoder output
- sample z using epsilon + $\text{Exp}(0.5 + \log - \text{Var}) + \text{mean}$

2) Build Encoder

- input $(28, 28, 1)$ image
- Apply Conv2D layers to extract features
- Flatten and use dense layer
- Output:- mean, log-var & sampled latent vector z

3) Build Decoder:

- input: latent vector (latent_dim)
- Dense-reshape to $(7 \cdot 7 \cdot 64)$
- Conv2D Transpose layer to upsample back to $(28, 28, 1)$ image

4) Define VAE model

- combine encoder decoder
- train the model apply gradients to update weights.

5) Train VAE

- load & normalize Fashion MNIST data
- fit model for desired epochs.

Q) Plot latent space

- create a 2D grid of latent point
- for each (x_i, y_i) , decode to generate an image
- place image in correct spot in large figure grid
- label areas as " $z[0]$ " & " $z[1]$ "
- Show the generated grid image.

Experiment - 4

Generative Adversarial Network

```
import tensorflow as tf  
from tensorflow.keras import layers  
import numpy as np  
import matplotlib.pyplot as plt
```

Algorithm:-

1) Load & prepare data:

Get MNIST images, scale them, add a channel, & create a batched dataset.

2) Build generator:-

Create a model that takes noise & generates images.

3) Build discriminator:-

Create a model that takes an image & O/P's if it's real or fake (using conv2D).

4) Setup Loss & Optimizer:-

use binary cross-entropy for loss; define generator & discriminator loss function. Use Adam optimizer.

5) Define Training Step:-

Create a function to perform one step: generate fake images, evaluate real/fake with discriminator, calculate losses, compute gradients & update model weights.

6) Run Training Loop:-

Iterate through epochs & dataset batches, calling training step. Generate & save images after epoch.

Experiment - 5

Image generation

```
# 1) Python code:  
# !Install dependencies  
# import libraries  
import torch  
from diffusers import PixArtAlphaPipeline  
  
# 2) Load a Transformer  
model_id = "PixArt-alpha/PixArt-XL-2-512x512"  
dtype = torch.float16 if torch.cuda.is_available() else  
torch.float32  
  
# 3) Prompt for face  
prompt = ("Ultra-realistic close-up portrait of  
a young adult human, neutral expression,  
natural soft lighting, 85mm lens back, high  
detail skin, photographic quality")  
negative_prompt = ("blurry low quality, extra finger  
fingers, extra eyes, deformed")  
  
# 4) generate image  
generator = torch.Generator(device=device).manual_seed(42)  
image = pipe(  
    ...  
    ...  
    ...).images[0]
```

5) Save & display

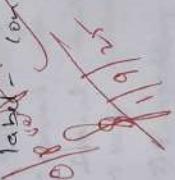

```
image.save("face.png")  
print("Saved to face.png")
```

Show image inside colab.

```
image.show()
```

OpenCV

- Experiment - 2 (with 7 rows) (5)
- Conditional GAN :-
Using both G and D during training
- 1) Initialization :-
Initial values of weights & bias
→ Set hyperparameters
- Initialize Generator G and Discriminator D
- Define loss function and optimizers
- 2) Data Preparation :-
Load mnist dataset
- Normalize images to the range [-1, 1]
- Convert labels into embeddings for condition
- 3) Training Loop :-
- a) For each batch
- Generate noise vector $z \in \mathbb{R}^n$ sample labels
- Generate fake image $G(z)$
- Train Discriminator with Real & Fake
- b) Update Parameters
- Back propagate & update D
- Back propagate & update G
- 4) Observation per Epoch :-
- Record Discriminator loss & Generator loss
- Observe training stability ($D\text{-loss}$ vs $G\text{-loss}$)

- 5) Visualisation:-
- Every 5 epochs, generate digits for labels 0-9
 - Compare the clarity in quality of digits across epochs
 - Note improvements in shape, changes in diversity
- 6) Final observations
- After 40 epochs, evaluate how realistic the generated digits are
 - Observe whether the generator produces label-conditioned digits correctly
- ~~label-conditioned digits correctly~~
- 

What is LLM

Large language Model:

In AI & NLP - an LLM is a type of artificial intelligence model trained on vast amounts of text data to understand and generate human-like language. Examples include GPT-3 & others. These models can perform tasks like answering questions, writing, translating, summarizing & more.

LLMs can also be used for generating new text based on a given prompt. They can be used for various applications such as chatbots, virtual assistants, and more.

LLMs have been trained on large amounts of text data, which allows them to learn patterns and relationships between words and phrases. This training process is called "fine-tuning".

LLMs can be used for various applications such as chatbots, virtual assistants, and more.

Experiment - 8

Retrieval-Augmented Generation

Inputs:

- A set of structured & unstructured documents
- A user query
- Retrieved embedding model
- Retrieved generation model

Outputs:

- A generated answer to the query based on retrieved documents.

Algorithm:

1) Preprocessing Document:

- Convert all structured document into a textual format that can be embedded
- keep unstructured document as they are

2) Embedding Document:

- Use a pretrained embedding model to compute vector embeddings for all documents.
- Store these doc embeddings in the vector index structure for fast similarity search

3) Query Processing on Retrieved

- Embed the incoming user query using the same embedding model
- Perform similarity search on the vector with query embedding to retrieve the K most relevant documents.

- 4) Answer Generation:
- Concatenate the retrieved documents into single textual context
 - Construct an input prompt for the generative model combining the query and retrieved contexts.
 - Use a pretrained generative language model to generate a natural language answer unconditionally on prompt.
- ↳ Based on the retrieved documents, construct a query and generate an answer.
- ↳ Example:
- Context: What is the capital of India?
- Retrieved documents:
- 1. New Delhi is the capital of India.
 - 2. The capital of India is New Delhi.
 - 3. The capital of India is New Delhi.
- Prompt:
- Q: What is the capital of India?
A: New Delhi
- Answer: New Delhi

Experiment 10

Radio App

- 1) Install Gradio
Use !Pip install gradio to make sure the library is available
- 2) Install & Import Gradio library
- 3) Define the function that processes input & produces output

4) Create Interface
wrap the function with a Gradio Interface or blocks to connect inputs & outputs.

5) Gradio interface by writing

- * function (fn =)
- * Input component (inputs = ----)
- * Output component (outputs= ----)

- 6) Launch the interface using .launch ()
- 7) Choose Input ~~Output~~ widgets.
Text box → for text input
Slider → for numeric range

checkbox → for true/false

Radio/Drop down → for multiple - choice of
Image | Video | Audio → for multimedia

JSON → for Structured Data

Block + Rows / Columns → for Custom

8) Launch the App:

call. launch() to open a local Small
app in the browser.

Open the browser and click on the
downloaded file.
~~Open the browser and click on the

Exp - II a. Chat app

Set up a FastAPI chatapp.

Algorithm :-

- 1) Install required packages : fastAPI, uvicorn, nest-asyncio, Pyngrok
- 2) Import necessary modules
- 3) Kill existing ngrok processes
- 4) Apply nest-asyncio patch
- 5) Create a fastAPI app
- 6) Define a message data model
- 7) Create API endpoints
- 8) Kill any existing ngrok tunnels.
- 9) Start ngrok tunnel on port 8000
- 10) Set ngrok auth token
- 11) Configure & run unicorn servers
- 12) Run their unicorn server asynchronously inside the current event loop

of self
11/10/2023

Experiment - II b

FastAPI chat Application with ngrok tunnel for public access in colab.

Algorithm:-

- 1) Install required packages (fastAPI, unicorn, nest-asyncio, pyngrok)
- 2) Kill any existing ngrok processes & wait for termination.
- 3) Apply nest-asyncio to allow nested async event loops in colab.
- 4) Create a fastAPI app with endpoints to send & retrieve chat messages stored in memory.
- 5) Kill any previous ngrok tunnels for a clean start.
- 6) Set ngrok authentication token.
- 7) Start an ngrok tunnel exposing port - 8000 & print the public url.
- 8) Configure & run the unicorn server inside the current async loop to serve the Fast API app.
